Abstract

AIM: This study aimed to the status of the nurses and midwives human resource and training institutes in India and variations across states.**METHOD:** This cross-sectional study collected information available from open sources (all data for the states) and supplemented with grey literature, as of 2019. The census population data were used for estimating the nurses and midwives dentistry. There was no sample selection. All the available information for the 30 states and six Union Territories were included.**RESULTS:** The auxiliary nurses and midwives (ANMs) density varied from 0.7 (Bihar and Telangana) to 26.6 (Andhra Pradesh) in states and 6.6 per 10,000 population at a national level. The registered nurses and midwives (RN/RM) density varied from 0.8 (Bihar) and 0.9 (Jharkhand) to 78.7 (Kerala) in states and 16.1 per 10,000 population at a national level. In 2019, there were 1890 ANM training schools, 3155 general nurses and midwives (GNM) training colleges, and 1958 Bachelor of Science (BSc) nursing training colleges in India. These institutions had 54,948 ANM, 227,370 GNM/BSc and 40,795 postgraduate nursing seats. With the current capacity, the nurses and midwives deficit can only be met in a 6–12 years period.**CONCLUSION:** India suffers from severe nurses and midwives shortage compared to the global norms with wide variations across the states. Increasing the training institution's number and seats are needed to meet the norms.**Keywords:** Human resources for health, India, nurses and midwives, nurses-population density, nursing education

Introduction

India has made significant progress in health indicators in recent times. In 2018, the crude birth and death rates were 20 (11% decline) and 6.2 (15% decline) per 1000 populations, respectively (Registrar General of India, 2020). Over the same period, the infant mortality rate (IMR) reached 32 per 1000 live births (decline by 36%) and the maternal mortality ratio (MMR) reached 113 per 100,000 live births (decline by 47%) (Registrar General of India, 2020). But this progress fell short to achieve the IMR and MMR goals of the National Rural Health Mission (NRHM) (IMR <30 per 1000 live births and MMR <100 per 10,000 live births by 2010) (Programme Evaluation Organization & Planning Commission, 2011) and the 12th five-year plan (IMR <25 per 1000 live births and MMR <100 per 10,000 live births by 2017) (Planning Commission, 2013). The human resource for health (HRH) has a significant contribution to these changes in health indicators, along with the infrastructural, systemic, and financial interventions (High Level Expert Group on Universal Health Coverage, 2010).

Healthcare (curative and preventive) services in India are delivered by a wide range of professionals including doctors, nurses and

midwives, paramedics, and support service providers. Additionally, there are dentists, Ayush doctors (under the indigenous Indian system of medicine including Ayurveda, Homeopathy, Unani, Siddha and Yoga), who provide clinical care. Nurses and midwives include the community level functionaries (auxiliary nurses and midwives, ANMs), general nurses and midwives (GNMs), graduate nurses, nurses with postgraduate and diploma in specialties. Additionally, physiotherapists, psychologists, paramedical technicians, other support functionaries contribute to India's HRH. Additionally, there are community-level functionaries, accredited social health activists (ASHAs) who assist in health service delivery from 2005 to 2006 onwards. Usually, the Ayush doctors and ASHAs are not included in the World Health Organization's (WHO) HRH index estimation (High Level Expert Group on Universal Health Coverage, 2010).

WHO has revised the minimum HRH norms from 22.8 (2006) to 44.5 (2016) health workers per 10,000 population to achieve sustainable development goals (SDGs) and universal health coverage (UHC) (World Health Organization, 2017b). The revised norm is almost double of India's current health-care workforce status. The Global Health Workforce Alliance

categorized India as one of the “most severe crisis” from the HRH aspect (Global Health Workforce Alliance & World Health Organization, 2013).

India has a large network of 160,713 health sub-centers (HSCs), 34,705 primary health centers (PHCs), 5863 community health centers (CHCs), 438 sub-district hospitals (SDHs), and 756 district hospitals (DHs) (as of March 2020) (Ministry of Health and Family Welfare, 2020). Under the Ayushman Bharat scheme, over 50,000 health wellness centers (HWCs, up-gradation of some HSCs and PHCs) have been established till now at the HSCs and PHCs and target for 150,000 HCWs by December 2020, to facilitate comprehensive primary healthcare services delivery (Ministry of Health & Family Welfare, 2018).

According to the government information, as of January 2019, the doctor: population ratio was 1:1457 for allopathic doctors and nurse: population ratio was 1:675, which was lower than the norms suggested by WHO (1:1000 for doctors and 3:1000 for nurses/midwives) (Ministry of Health and Family Welfare, 2019). Nurses and midwives (34.4%) and ANMs (14.1%) constitute the major share of the HRH in India (2016–2017) (Nair, 2019). In 2010, a high-level expert group (HLEG) on UHC in India recommended several strategies for addressing the HRH gaps to achieve the UHC including two ANMs and a nurse practitioner at HSCs, increasing the number of nursing and midwifery training institutions and career progression for nurses and midwives along with the allopathic and Ayush doctors and other allied health workforce (High Level Expert Group on Universal Health Coverage, 2010). Since then several efforts to augment the HRH production in India including nurses and midwives have been initiated by the Government of India (Ministry of Health and Family Welfare, 2019).

There is a need to document the status of the nurses and midwives availability and the training capacity of the institutions in India for appropriate planning at national and state levels. The aim of the study was “what is the present status of the nurses and midwives HRH, the training capacity of the institutions in India and the trend since 2004?” This report presents the current status of the nurses and midwives HRH and their education opportunities in India and the changes over the last two decades.

Research Questions

1. What is the status of the nurses and midwives HRH in India?
2. What is the profile of the nurses and midwives educational institutions and their training capacity in India?

Methods

Study Design

This study is a descriptive and cross-sectional situational analysis.

Sample

There was no sample selection. This study collected all available data for the nurses and midwives HRH status for all the states, Union Territories and national level as of 2019 and their

educational institutes and seats during 2004 and 2019. The study included data for the national and states level of India.

Data Collection

In this study, the health management and information system reports of the Ministry of Health and Family Welfare, Government of India for the period 2019–2020 (as of June 2020) were used. The list of nurse and midwife training institutions, courses and student intake capacity available from the Nursing Council of India (INC, website: <https://www.indiannursingCouncil.org>; last updated 15 December 2020) were manually compiled. The data for nurses and midwives for India and different states were extracted from other published literature and grey literature available in the open domain (the keywords used: nurses, nursing, midwife, midwives, nursing council, registration, education, courses, schools, workforce, human resources, shortage, migration, India, and states). The population of India and the states for 2019 were estimated using the Census 2011 data and decadal growth rate (Registrar General & Census Commissioner, India, 2013). Both authors participated in document search, data collection, and analysis.

Data Collection Tools

The data from various sources were abstracted and collated according to the types of courses, institutions, states, and years.

Statistical Analysis

Descriptive analysis was undertaken for the information extracted from different sources using excel and STATA 15.0 (Stata Corporation, Texas, USA). The data were presented as absolute numbers, percentages, average, standard deviation, minimum and maximum for the states, Union Territories and national level. The information for the year 2019–2020 was used for estimation of the nurses and midwives density per 10,000 population for the personnel in position and seats for training at state and national levels. Similarly, for different courses, the seat index per 10,000 population at state and national levels was also estimated.

Ethical Considerations

As data used for this study were obtained from publicly available sources and not linked to any identifiable individual, explicit individual consent was not required. The protocol was reviewed by INCLIN Independent Ethics Committee (Ref no-22, Date January 20, 2020) and exempted.

Results

Nurses and Midwives Density

According to the available information from the Government of India (2018), there were 872,693 ANMs, 56,602 lady health visitors (LHVs; supervisors of ANMs with 6 months additional training), and 2,108,919 RNs/RMs. As reflected in Table 1, at the national level, the population densities for ANM, RN/RM, LHV, and all nurses and midwives pooled were 6.6, 16.1, 0.4, and 23.2 per 10,000 population. The figures for some union territories (UTs) were not available. The ANM density per 10,000 population varied from 0.7 in Bihar and Telangana to 26.6 in Andhra Pradesh. From these figures, it appears that there were discrepancies in the available numbers for the states Andhra Pradesh

and Telangana, which were separated in 2014. The RN/RS density per 10,000 population varied from 0.8 in Bihar and 0.9 in Jharkhand to 78.7 in Kerala. The LHV density per 10,000 population varied from zero in 10 states to 2.4 in Kerala, and LHV is considered as a dying cadre. At pooled level, the nurses and midwives density per 10,000 population was lowest in Bihar (1.6) and highest in Kerala (89.9). Eleven states had the nurses and midwives density above three per 1000 population, meeting the WHO norm (Table 1, 2).

Nurses and Midwives Education

According to the INC, there are several nurse and midwifery courses being offered in India including certificate, diploma, degree (graduate, postgraduate, and PhD) programs, some are awarded by the nursing boards and others by the universities (Table 3). The ANM, GNM, and BSc nursing courses are the major ones offered. According to the level of engagement and function in the public health system, the ANMs and LHVs primarily function at the HSC and PHCs. The GNMs usually function as staff nurses and midwives at the PHC, CHC, SDH, and DHs. The MSc, MPhil, and PhD degree holders are usually engaged in teaching institutes and medical or dental colleges. The private sector health institutions also engage the nurses usually with GNM and BSc degrees, while the super-specialty hospitals may engage the PBBSc and additional certificate course qualified nurses. The BSc, PBBSc, and postgraduate degree holders usually also migrate to other countries.

The INC and the 29 state nursing councils (SNCs) oversee nursing education in the country and respective states. The SNCs register the students passing out from the institutions in their respective states. No SNC exists in the UTs and state of Nagaland. In 2019, there were 1890 ANM training schools, 3155 GNM training colleges, and 1958 BSc nursing training colleges in India. Additionally, 765, 217, and 650 colleges offered PBBSc certificate, PBBSc diploma in nursing, and MSc courses. Between 2004 and 2019, in India, the numbers of nursing institutions have increased by 8.8 times for ANM courses, 4.6 times for GNM courses, 10.6 times for BSc courses, 20.7 times for PBBSc courses, and 20.3 times for MSc courses (Figure 1). The rise in institutions has been higher from 2010 onwards. The rise in MPhil, PhD, and other specialty courses was very small compared to the others. The rise in the number of institutions was higher in some states (Assam, Bihar, Chhattisgarh, Delhi, Gujarat, Haryana, Jammu and Kashmir, Jharkhand, Karnataka, Madhya Pradesh, Maharashtra, Odisha, Punjab, Tamil Nadu, and Uttar Pradesh), especially for the ANM, GNM, and BSc courses (Supplementary Tables 1-6).

In 2019, the institutions had 54,948 ANM seats, 227,370 GNM or BSc nursing seats, and 40,795 post-BSc or postgraduate courses. While ten states had >10,000 GNM/BSc seats, only three states had >5000 ANM seats. Six states had >2000 seats in regular postgraduate or diploma or certificate nursing courses. Table 2 summarizes the nurses and midwifery course seat index at the state and national level for the year 2019.

Adequacy of the Institutions and Student Intake Capacity

According to the HLEG for UHC estimate, the ANM cadre requirement for 2022 was 832,178. According to the INC, the

annual ANM intake capacity was 39,325 in 2019. Considering the availability of 80% of the registered ANMs in service, 80% of the newly trained ANMs join public health service and annual attrition of 3% due to various reasons, the estimated time needed to meet the estimates is 12 years. The HLEG estimated the nursing cadre requirement for 2022 as 1,616,227. According to the INC, the annual GNM and BSc nursing intake capacity was 177,368 in 2019. Considering the availability of the registered nurses as 60% (adjusting for the migration, joining private sector) and 60% of the newly trained nurses joining public health services and 3% annual attrition due to various reasons, the estimated time needed to meet the estimates is 5–6 years. With population growth, the public health infrastructure shall also need expansion. Additionally, the augmentation of public health infrastructure with HWCs has escalated the HRH demand. With these expansions, the HRH demands are expected to multiply by at least 125%. Considering the expansion of private sector health infrastructure, the HRH, especially the nursing cadre training shall need augmentation to meet the demand in coming years.

Nurses and Midwifery Journals from India

On searching, 21 nurses and midwifery journals published from India were retrieved (Table 4). None of these were indexed in PubMed. Six of these were published by Tamil Nadu Nurses and Midwives Council.

Discussion

This paper presents the status of the nurses and midwives cadre HRH and the training institutes for nurses and midwives in India as of 2019. This paper estimated the nurses and midwives density for the states in India and the national level. According to the estimated nurses and midwives density, eleven states met the WHO norm and six states had < 1 nurse/midwife per 1000 population. The status of union territories (except Delhi) and Jammu and Kashmir were not available.

It was observed that considering the public health infrastructure, there is a gross deficit in the existing nursing cadre HRH in India. The available nurses and midwives density in India was 1:2000 (0.5 per 1000 population), which is low compared to the density in the lower middle (1.7 per 1000 population), upper-middle (2.7 per 1000 population), and high income (7.1 per 1000 population) countries in 2013 (World Health Organization, 2017a). The Indian nurses and midwives density is lower than the overall density in the WHO Southeast Asia region (1.5 per 1000 population) (World Health Organization, 2017a).

According to the National Sample Survey Organization survey (India, 2016), about 78.7% of the nurses and midwives were registered. The HRH density per 10,000 population for the nurses and midwives was 12.7 and for the ANMs were 6.0 at the national level. The report also noted that 58% of the nurses and midwives had inadequate qualifications or training in India. After adjusting for the inadequate qualifications, the nurses and midwives density per 10,000 population dropped from 12.7 to 4.2. While 44.8% of the nurses and midwives were in the public sector, 55.3% were in the private sector (Karan et al., 2019).

Figure 1.

The Trend of Nursing Institutions in India During 2004 and 2019.

ANM=Auxiliary Nurse and Midwife; GNM=General Nursing and Midwifery; BSc=Bachelor of Science Nursing-Basic; MSc=Masters of Science Nursing; PBBSc=Post Basic BSc Nursing; PBDC=Post Basic certificate and diploma courses.

This indicates the unavailability of adequately trained nurses in the public sector. The status may be more in the private sector. About two-thirds (67%) of the nurses and midwives were working in the urban areas (Karan et al., 2019). The density of nurses and midwives in the urban area in India was 7.2 compared to 1.3 per 10,000 population in rural areas. The share of inappropriately qualified nurses and midwives in rural areas was 68.2% compared to 56.2% in urban areas (Rao et al., 2016).

The existing courses and training capacity of the institutes appear inadequate to meet the nursing HRH demand in the coming decade. If the demand for the growing private health-care sector is considered, the demand expands further. From 2010 onwards the number of nurses and midwives training institutions, especially for the ANM, GNM, and BSc nursing courses has increased significantly. The nurses and midwives training institutions are unevenly distributed across the states. In 2019, the pooled nursing course seat density was <1 per 10,000 population in three states. Some states like Maharashtra, Karnataka, Kerala, Punjab, Madhya Pradesh, Tamil Nadu, and Uttar Pradesh had more institutions and seats. While most of the states had more seats for GNM/BSc nursing training, ANMs, Bihar, and Jharkhand had more ANM seats. Despite the rise in the number of institutions, it is estimated that at this pace, the existing gaps shall be met in 5–12 years period for different nurses and midwives cadres according to the education levels.

These numbers of seats don't reflect the actual availability of nurses and midwives for service in India. Under the NRHM, efforts were made to expand the HRH base with the induction of new manpower through contractual arrangements. Due to the lower salary, no continuity assurance, no promotion plan, and lack of additional benefits, after few years, several of these workers have

been agitating and going on strikes seeking regularization of services (Gill, 2016). In India, the nurses and midwives workforce are also challenged by the societal class, caste system, and family level decision-making dynamics (Gill, 2016).

It is estimated that about 20% of the nursing workforce, especially those with qualifications BSc nursing and above, migrate to other countries (Hawkes et al., 2009; Thompson & Walton-Roberts, 2019). Over the last few decades, mass migration and recruitment drives for high-income countries through agencies are being organized. India stands the second source of migrated nurses to the United Kingdom after Indonesia. It is reported that about 16,000–18,000 nurses migrate annually from India (Srinivasan, 2016). Job satisfaction, salary, working conditions, professional status, career prospects, and overall living conditions are the key drivers for migration to other countries (Garner et al., 2015; Thomas, 2006).

The education and practice of nursing and midwifery are clubbed in India. The graduates are expected to play a need-based dual role of nurse and midwife. The current Indian Nursing Council Act and some state nurses Acts don't ask for regular updating of knowledge and skills through continued education or in-service training. The nurses and midwives face challenges from the trainee doctors and supervisors for practice with minimal continued practice of skills. Several of the nursing and midwifery institutions face challenges including infrastructure, availability of adequate teachers and quality teaching, and adequate supervision as per the INC's guidelines (Mayra et al., 2020). To push the infant and maternal mortality reduction agenda and achieve the targets under SDGs, there is a need to focus on nursing and midwifery training and skill sustenance. Simultaneously to support the advancements in medical services and provide

Note: ^aIndex estimated per 10,000 population using nursing and midwife course seats according to Indian Nursing Council (for the year 2019–20) and population estimated for 2019 using Census 2011 and decadal growth rate.

ANM=Auxiliary Nurse and Midwife; GNM=General Nursing and Midwifery; BSc=Bachelor of Science Nursing-Basic; MSc=Masters of Science Nursing; PBBSc=Post Basic BSc Nursing; Others: Included MPhil, PhD, certificate, and diploma courses.

Table 3
The types of nursing academic courses in India

Type of course	Eligibility	Course duration	Type of examination	Registration	Work prospects
Auxiliary Nurse & Midwife (ANM)	10 th grade pass	2 years	Nursing Examination Board*	RANM	HSCs and PHCs
General Nursing & Midwifery (GNM)	12 th grade pass with minimum of 40% aggregate marks Age 17-35 years OR Registered ANM/LHV	3 and 1/2 years; 3 years from 2015-2016	Nursing Examination Board*	RN/RM	PHCs, CHCs, Public health hospitals
B. Sc (Basic)	12 th grade pass with PCBE subjects and minimum of 45% aggregate marks	4 years	University	RN/RM	DH, MCH and SSH
B.Sc (Post Basic)	12 th grade pass+ GNM pass	Regular: 2 years Distance: 3 years	University	Additional	DH, MCH and SSH
M. Sc.	B.Sc. Nursing/ B.Sc. Honors Nursing/ Post Basic B.Sc. Nursing with minimum of 55% aggregate marks Minimum one year of work experience after Basic B.Sc. or Post-Basic B.Sc. Nursing	2 years	University	Additional	ANMS, NS/NC, MCH and SSH
MSc Nurse practitioner courses	B.Sc. Nursing with minimum of 55% aggregate marks Minimum of one year clinical experience	2 years	University	Additional	MCH and SSH
M. Phil	M.Sc. Nursing	1 year (Full time) 2 years (part time)	University	Additional	NS/NC, MCH and SSH
PhD	M.Sc./M.Phil.	3-5 years	University	Additional	NS/NC, MCH and SSH
Post Basic Specialty Diploma/Nurse Practitioner Courses	B.Sc Nursing with 1-3 years of clinical experience	1 year	Nursing Examination Board*	Additional	MCH and SSHs
Lady Health Visitor (LHV)	ANM	6 months	Nursing Examination Board*	Additional	PHCs and CHCs

Note: *Nursing Examination Board, non-university programmes

RANM and RN/RM: Registered with the State Nurses and Midwives Registration Council

Abbreviations: ANM: Auxiliary Nurse and Midwife; B.Sc: Bachelor in Science; DH: District Hospital; HSC: Health Sub-centres; LHV: Lady Health Visitor; MCH: Medical College Hospital; M.Sc: Masters in Science; NS/NC: Nursing School or Nursing College; PHC: Primary Health Centre; RANM: Registered Auxiliary Nurse & Midwife (ANM); RN/RM: Registered Nurse and Registered Midwife; SSH: Super specialty hospital.

world-class clinical services for patients from India and other developing countries, there is a need to focus on improving the quality of nursing education and creating opportunities for specialized nursing training and certification. Thus, the Indian nursing and midwifery academic sector is facing both quantity and quality challenges, which require strategic thinking and appropriate investments. Additionally, there is also a need for pushing the research agenda in nursing and midwifery and promote nurse-researchers to address the context-specific and socio-cultural appropriate issues to improve the quality of clinical care and patient satisfaction. Attention is also needed for the dedicated nursing and midwifery journals, promoting quality publications and indexing them.

Study Limitations

The study has some limitations. The data used for this study are secondary and taken from government data sources, which might suffer from completeness and validation challenges. The segregation for the public- and private sector was not available.

Conclusion and Recommendations

India suffers from a gross shortage of nurses and midwives HRH compared to the global norms with wide inter-state variations. The states with a lesser number of nursing and midwife training institutions have a severe deficit. With inadequate HRH status and sub-optimal skills, the national health policy and SDG goals cannot be achieved in the planned timeline. While the primary focus at present appears to be on the number of nurses and midwives, the efforts for improving the skills, specialized nursing services and research in nursing and midwifery must also be emphasized. Retention of qualified nurses and outmigration of nurses remain constant challenges for India.

Although there is an encouraging rise in the number of institutions and seat availability for the training of nurses and midwives over the last decade, there is a need for a further increase over the next five years to meet the global norm in a shorter timeline. In parallel to the increase in the numbers of institutions

Table 4
List of Journals with nursing and midwifery focus published from India

S. No.	Title of the Journal	Published by institute/association	Pubmed Indexed
1	Indian Journal of Continuing Nursing Education	College of Nursing, Christian Medical College, Vellore, Tamil Nadu	No

and seats, there is a need to focus on the quality of training, skill retention and new competencies acquisition to support the advancements in clinical, nursing, and midwifery care. In international migration of nurses from India also must be factored in while planning the nursing training institutions and intake capacity for India and states. Additionally, there is a need to focus on creating opportunities for training and services in specialty nursing disciplines to appropriately support the advancement in clinical care.

Ethics Committee Approval: Ethics committee approval was received for this study from the ethics committee of INCLIN Independent Ethics Committee (Date: January 20, 2020, Ref no- IIEC-022).

Peer-review: Externally peer-reviewed.

Author Contributions: Concept – M.K.D.; Data Collection and/or Processing – M.K.D., D.S.; Analysis and/or Interpretation – M.K.D.; Writing Manuscript – M.K.D., D.S.; Critical Review – M.K.D., D.S.

Conflict of Interest: The authors have no conflicts of interest to declare.

Financial Disclosure: The authors declared that this study has received no financial support.
